

One in a series of tip sheets about HEDIS® and other measures that contribute to star ratings of Medicare Advantage plans.

# **Breast Cancer Screening (BCS)**

Effectiveness of Care HEDIS® Measure

#### Measure definition

Female patients ages 52 to 74 who had a mammogram to screen for breast cancer any time on or between October 1 two years prior to the measurement year and December 31 of the measurement year.

#### **Exclusions**

Patients are excluded if they:

- Have a history of mastectomy on both the left and right side on the same or different dates of service.
- Received hospice care during the measurement year.
- Are age 66 and older with advanced illness and frailty (for additional definition information, see the Advanced Illness and Frailty Guide).
- Are deceased during the measurement year.
- Received palliative care during the measurement year.

### Information that patient medical records should include

- Date the mammogram was performed.
- Documentation of mastectomy and date performed (if exact date is unknown, the year is acceptable).

# Information that patient claims should include

If the patient met exclusion criteria, include the following ICD-10-CM diagnosis codes on the claim, as appropriate:

ICD-10-CM code	Description
Z90.11	Acquired absence of right breast and nipple
Z90.12	Acquired absence of left breast and nipple
Z90.13	Acquired absence of bilateral breasts and nipples

# Tips for success

- Create a standing order to mail to patient for mammography.
- Provide a list of locations where mammogram screenings can be performed.
- If telehealth, telephone or e-visits are used instead of face-to-face visits, discuss the need for breast cancer screening and mail a mammogram order with location of testing facility and phone number.

## Tips for talking with patients

Educate patients about the importance of routine screening:

- Many women with breast cancer do not have symptoms, which is why regular breast cancer screenings are so important.
- Mammograms are an effective method for detecting breast cancer in early stages, when it is most treatable.<sup>1</sup>
- The recommended frequency of routine mammograms is at least once every 24 months for all women ages 50 to 74. Depending on risk factors, mammograms may be done more frequently.
- The accuracy of mammography improves as women age and has an overall detection rate of about 85 percent.<sup>2</sup>
