Overview

New Directions Behavioral Health® manages Applied Behavior Analysis (ABA) benefits Blue Cross Blue Shield of Michigan. This medical necessity criteria is used to review and make benefit decisions for ABA service requests for members with the diagnosis of Autism Spectrum Disorder (ASD).

ASD is a medical, neurobiological, developmental disorder, characterized by Core Deficit areas: persistent deficits in social communication and social interaction across multiple contexts AND, restricted, repetitive patterns of behavior, interests, and activities. Diagnostic and Statistical Manual fifth edition (DSM-5) requires all of these symptoms to be present in early development, and further specifies clinically significant impairment in social, occupational or other important areas of current function. Benefit coverage for behavioral therapies to treat symptoms of ASD is driven by individual state mandates. Health plans for which New Directions currently administers the ASD benefit may consider ABA to be experimental/investigational and therefore a non-covered service without a controlling state mandate. In addition, large self-funded accounts may provide a benefit for ABA in ASD. These are not typically subject to mandate language.

ABA is the behavioral treatment approach most commonly used with children with ASD. Techniques based on ABA include: Discrete Trial Training, Incidental Teaching, Pivotal Response Training, and Verbal Behavioral Intervention. ABA involves a structured environment, predictable routines, individualized treatment, transition and aftercare planning, and significant family involvement. ABA attempts to increase skills related to behavioral deficits and reduce behavioral excesses including eliminating barriers to learning. Behavioral deficits may occur in the areas of communication, social and adaptive skills, but are possible in other areas as well. Examples of deficits may include: a lack of expressive language, inability to request items or actions, limited eye contact with others, and inability to engage in age-appropriate self-help skills such as tooth brushing or dressing. Examples of behavioral excesses may include, but are not limited to: physical aggression, property destruction, elopement, self-stimulatory behavior, self-injurious behavior, and vocal stereotypy.

At an initial assessment, target symptoms are identified. A treatment plan is developed that identifies the core deficits and aberrant behaviors, and includes designated interventions intended to address these deficits and behaviors and achieve individualized goals. Treatment plans are usually reviewed for medical necessity (defined below) twice annually (frequency dependent upon the controlling state mandate) to allow re-assessment and to document treatment progress.

A Functional Behavioral Assessment (FBA) may also be a part of any assessment. A FBA consists of
a. Description of the problematic behavior (topography, onset/offset, cycle, intensity, severity)
b. History of the problematic behavior (long-term and recent)
c. Antecedent analysis (setting, people, time of day, events)
d. Consequence analysis
e. Impression and analysis of the function of the problematic behavior

Medical Necessity
These criteria will be applied to all service requests received by New Directions Autism Resource Program.

New Directions defines “Medical Necessity” or “Medically Necessary” as health care services rendered by a provider exercising prudent clinical judgment, which are:

A. Consistent with:
   1. The evaluation, diagnosis, prevention, treatment or alleviation of symptoms of an illness, disease or injury defined by the current Diagnostic and Statistical Manual of Mental Disorders (DSM)
   2. Generally accepted standards of medical practice, as defined by credible scientific evidence published in peer-reviewed medical literature, which are generally recognized by the appropriate medical community, Physician Specialty Society recommendations and other relevant factors

B. Clinically appropriate and designed to meet the individualized needs of the patient with regard to type, frequency, extent, site and duration of services

C. Considered effective to improve symptoms associated with the patient’s illness, disease, injury or deficits in functioning

D. Provided at the least restrictive and most clinically appropriate service or level of care to safely, effectively, and efficiently meet the needs of the patient

E. Required for reasons other than the convenience of the patient, family/support system, physician or other health care provider

F. Not a substitute for non-treatment services addressing environmental factors

G. Not more costly than an alternative service or services, which are at least as likely to produce equivalent diagnostic or therapeutic results for the patient’s illness, disease or injury

Admission/Severity of Need Criteria
New Directions may authorize ABA services for ASD only if criteria 1 or 2 and 3 are met:

**COMPREHENSIVE DIAGNOSTIC EVALUATION**

1. The member has a diagnosis of Autism Spectrum Disorder (ASD) and a recommendation for ABA treatment made as a result of an evaluation at a Michigan Approved Autism Evaluation Center (AAEC). If the member is located out of the state of Michigan, the diagnosis requires all evaluation components listed in the Michigan Blue out-of-state Multidisciplinary Evaluation Checklist (MEC).
2. [Note: This criterion includes cases in which the member has a diagnosis of Autism Spectrum Disorder (ASD) from a qualified health care professional, as defined below, and has begun but not yet completed the AAEC evaluation or all the components listed in the MEC.]
   a. A “qualified health care professional” is a professional who can conduct the diagnostic evaluation. Such professional is typically one of the following: pediatric neurologist, developmental pediatrician, board-certified pediatrician, board-certified child psychiatrist, fully licensed child psychologist, or medical doctor experienced in the diagnosis of ASD
   b. Diagnostic evaluation with order / treatment recommendation for treatment includes:
      i. A detailed developmental and medical history, including medical records from prior clinicians
      ii. developmental and cognitive evaluation
      iii. medical comorbidity
      iv. neurological evaluation
      v. autism specific assessments by a qualified health care professional licensed to diagnose behavioral/ medical conditions
      vi. adaptive behavior assessment

3. Member is within the age range specified in the applicable health plan’s member service plan description or in the applicable state mandate for treatment.

**ABA TREATMENT ASSESSMENT**

New Directions may authorize an ABA services assessment only if all of the following criteria are met:

1. Diagnostic Criteria as set forth in the current DSM are met;
2. Hours requested are not more than what is required to complete the treatment assessment.

Note: Standardized psychological testing services are billed with specific psychological testing AMA-CPT code by eligible providers. Typically, a clinical psychologist is qualified to provide testing services.

**INITIAL ABA SERVICE TREATMENT REQUEST**

New Directions may authorize the initiation of ABA services for ASD only if all of the following criteria are met:

1. Diagnostic Criteria as set forth in the current DSM are met;
2. The ABA services recommended do not duplicate or replicate services received in a member’s primary academic educational setting, or are available within an Individualized Education Plan (IEP) or Individualized Service Plan (ISP);
3. The ABA services recommended do not duplicate services provided or available to the member by other medical or behavioral health professionals;
4. Approved treatment goals and clinical documentation must be focused on active ASD core symptoms and deficits that inhibit daily functioning. This includes a plan for stimulus and response Generalization in novel contexts;

5. When there is a history of ABA treatment, the provider reviews the previous ABA treatment record to determine that there is a reasonable expectation that a member has the capacity to learn and generalize skills to assist in his or her independence and functional improvements;

6. Adaptive Behavior Testing such as the Vineland and ABAS testing within a 45-day period before or after the initial service start date;

7. For comprehensive treatment, the requested ABA services are directed toward reducing the gap between the member’s chronological and developmental ages such that the member is able to develop or restore function to the maximum extent practical;

   OR

   For focused treatment, the requested ABA services are designed to reduce the burden of selected targeted symptoms on the member, family and other significant people in the environment, and to target increases in appropriate alternative behaviors;

8. Treatment intensity does not exceed the member’s functional ability to participate;

9. Hours per week requested are not more than what is required to achieve the goals listed in the treatment plan and must reflect the member’s, caregiver’s, and provider’s availability to participate in treatment;

10. A comprehensive medical record is submitted by the Board Certified Behavior Analyst (BCBA) to include:

   a. All initial assessments performed by the BCBA. Preferred assessments must be developmentally and age appropriate and include the ABLLS, VB-MAPP, and any other developmental measurements employed. Only those portions of assessments that address core deficits of autism are covered; this excludes assessments or portions of assessments that cover academic, speech, vocational deficits, etc.;

   b. Individualized treatment plan with clinically significant and measurable goals that clearly address the active symptoms and signs of the member’s core deficits of ASD;

   c. Goals should be written with measurable criteria such that they can be reasonably achieved within six months;

   d. Goals should include: documentation of core symptoms of ASD in the treatment plan, date of treatment introduction, estimated date of mastery, and a specific plan for Generalization of skills;

   e. Functional Behavior Assessment to address targeted problematic behaviors with operational definition and provide data to measure progress, as clinically indicated;

   f. Documentation of treatment participants, procedures and setting;

11. Direct line therapy services are provided by a line therapist, Registered Behavior Technician (RBT), or Board Certified Assistant Behavior Analyst (BCaBA), supervised by a BCBA or Doctoral level BCBA (BCBA-D), or provided in a manner consistent with the controlling state mandate. In selected circumstances, New Directions will consider direct 1:1 services provider by a BCBA or BCBA-D.

12. Caregiver participation in at least 80 percent of scheduled caregiver training sessions. Caregiver training is defined as the education and development of caregiver-mediated ABA strategies, protocols, or techniques directed at facilitating, improving, or generalizing social
interaction, skill acquisition and behavior management, to include observational measures for assurance of treatment integrity. It is recommended that one hour of caregiver training occurs for the first 10 hours of direct line therapy, with an additional 0.5 hours for every additional 10 hours of scheduled direct line therapy unless contraindicated or caregiver declines. Caregiver training requirements should increase to a higher ratio of total direct line therapy hours as increased number of member goals address activities of daily living, as provider plans for transition to lower level of care within the next 6 months or as member comes within one year of termination of benefits based on policy benefit restrictions. Caregiver training is necessary to address member’s appropriate Generalization of skills, including activities of daily living, and to potentially decrease familial stressors by increasing member’s independence. ABA principles utilized during caregiver training to achieve desired outcomes may include, but are not limited to, reinforcement, task analysis, prompting, fading, shaping and chaining.

13. Although not required for the initial service request, transition and aftercare planning should begin during the early phases of treatment.

**Intensity of Service Criteria**

Comprehensive treatments range from 25 to 40 total hours of direct services weekly. However, New Directions will review each request on an individual basis for fidelity to medical necessity and approve total hours based on the member’s severity, intensity and frequency of symptoms. Comprehensive treatment includes direct 1:1 ABA, caregiver training, supervision and treatment planning.

Comprehensive ABA treatment targets members whose treatment plans address deficits in all of the core symptoms of Autism. Appropriate examples of comprehensive treatment include: early intensive behavioral intervention and treatment programs for older children with aberrant behaviors across multiple settings. This treatment level, which requires very substantial support, should initially occur in a structured setting with 1:1 staffing and should advance to a least restrictive environment and small group format. Caregiver training is an essential component of Comprehensive ABA treatment. This treatment is primarily directed to children ages 3 to 8 years old because Comprehensive ABA treatment has been shown to be most effective with this population.

Focused treatments range from 10 to 25 total hours per week. However, New Directions will review each request on an individual basis for fidelity to medical necessity and approve total hours based on the member’s severity, intensity and frequency of symptoms. This treatment may include caregiver training as the only component.

Focused treatment typically targets a limited number of behavior goals requiring substantial support. Behavioral targets include marked deficits in social communication skills and restricted, repetitive behavior such as difficulties coping with change. In cases of specific aberrant and/or restricted, repetitive behaviors, attention to prioritization of skills is necessary to prevent and offset exacerbation of these behaviors, and to teach new skill sets. Identified aberrant behaviors should be addressed with specific procedures outlined in a Behavior Intervention Plan. Emphasis is placed on group work and parent training to assist the member in developing and enhancing his/her
participation in family and community life, and developing appropriate adaptive, social or functional skills in the least restrictive environment.

Requested treatment hours outside of the range for Comprehensive or Focused treatment will require a specific clinical rationale.

**Hours to be Authorized**

Total authorized hours will be determined based on all of the following:

- The current medical policy and medical necessity
- Provider treatment plan, that identifies suitable behaviors for treatment and improves the functional ability across multiple contexts
- Member’s age
- Severity of symptoms, including aberrant behaviors
- Continued measurable treatment gains

**Caseload Size**

The Behavioral Analyst Certification Board’s ("BACB") *Applied Behavior Analysis Treatment of Autism Spectrum Disorder: Practice Guidelines for Healthcare Funders and Managers, 2nd Edition*, [page 35], states that Behavior Analysts should carry a caseload that allows them to provide appropriate case supervision to facilitate effective treatment delivery and ensure consumer protection.

Caseload size for the Behavior Analyst is typically determined by the following factors:

- Complexity and needs of the clients in the caseload
- Total treatment hours delivered to the clients in the caseload
- Total case supervision and clinical direction required by caseload
- Expertise and skills of the Behavior Analyst;
- Location and modality of supervision and treatment (for example, center vs. home, individual vs. group,)
- Availability of support staff for the Behavior Analyst (for example, a BCaBA).

The recommended caseload range for one (1) Behavior Analyst is as follows:

**Supervising Focused Treatment**

- Without support of a BCaBA is 10 - 15*
- With support of one (1) BCaBA is 16 - 24*

Additional BCaBAs permit modest increases in caseloads.

* Focused treatment for severe problem behavior is complex and requires considerably greater levels of case supervision, which will necessitate smaller caseloads.

**Supervising Comprehensive Treatment**

- Without support of a BCaBA is 6 - 12
- With support of one (1) BCaBA is 12 - 16

Additional BCaBAs permit modest increases in caseloads.
**Continued Stay Criteria**

New Directions may authorize continued ABA treatment services for ASD only if all of the following criteria are met:

1. Diagnostic Criteria as set forth in the Initial Review Criteria are met
2. The ABA services recommended do not duplicate or replicate services received in a member’s primary academic educational setting, or are available within an Individualized Education Plan (IEP) or Individualized Service Plan (ISP);
3. The ABA services recommended do not duplicate services provided or available to the member by other medical or behavioral health professionals;
4. Approved treatment goals and clinical documentation must be focused on active ASD core symptoms and deficits that inhibit daily functioning. This includes a plan for stimulus and response Generalization in novel contexts;
5. Adaptive Behavior Testing such as the Vineland and ABAS testing annually within a 45-day period before the next scheduled concurrent review. The Vineland or other standardized psychological tests may be required on any concurrent review dependent on clinical information obtained during the course of ABA treatment;
6. For comprehensive treatment, the requested ABA services are directed toward reducing the gap between the member’s chronological and developmental ages such that the member is able to develop or restore function to the maximum extent practical; OR
   For focused treatment the requested ABA services are designed to reduce the burden of selected targeted symptoms on the member, family and other significant people in the environment, and to target increases in appropriate alternative behaviors;
7. Treatment intensity does not exceed the member’s functional ability to participate;
8. Hours per week requested are not more than what is required to achieve the goals listed in the treatment plan and must reflect the member’s, caregiver’s, and provider’s availability to participate in treatment;
9. A comprehensive medical record is submitted by the BCBA to include:
   a. Collected data, including additional testing such as ABLLS, VB-MAPP or other developmentally appropriate assessments, celeration charts, graphs, progress notes that link to interventions of specific treatment plan goals/objectives. Only those portions of assessments that address core deficits of autism are covered; this excludes assessments or portions of assessments that cover academic, speech, vocational deficits, etc.;
   b. Individualized treatment plan with clinically significant and measurable goals that clearly address the active symptoms and signs of the member’s core deficits of ASD;
   c. Goals should be written with measurable criteria such that they can be reasonably achieved within six months;
   d. Goals should include documentation of core symptoms of ASD identified on the treatment plan, date of treatment introduction, estimated date of mastery, a specific plan for Generalization of skills, and the number of hours per week estimated to achieve each goal;
e. Functional Behavior Assessment to address targeted problematic behaviors with operational definition and provide data to measure progress, as clinically indicated;
f. Documentation of treatment participants, procedures and setting;

10. Direct line therapy services are provided by a line therapist, or RBT, or BCaBA, supervised by a BCBA or BCBA-D, or the provision of services is consistent with the controlling state mandate. In selected circumstances, New Directions will consider direct one to one services provider by a BCBA or BCBA-D.

11. On concurrent review, the current ABA treatment demonstrates significant improvement and clinically significant progress to develop or restore the function of the member.
   a. Significant improvement is mastery of a minimum of 50 percent of stated goals found in the submitted treatment plan. Psychological testing may be requested to clarify limited/lack of treatment response. Adaptive behavior, cognitive and/or language testing must show evidence of measurable functional improvement, as opposed to declining or plateaued scores. For members who do not master 50 percent of stated goals and/or fail to demonstrate measurable and substantial evidence toward developing or restoring the maximum function of the member, the treatment plan should clearly address the barriers to treatment success;
   b. There is reasonable expectations of mastery of proposed goals within the requested six-month treatment period and that achievement of goals will assist in the member’s independence and functional improvements;
   c. There is a reasonable expectation that a member is able to, or demonstrates the capacity to, acquire and develop clinically significant generalized skills to assist in his or her independence and functional improvements;
   d. If the member does not demonstrate significant improvement or progress achieving goals for successive authorization periods, benefit coverage of ABA services may be reduced or denied;

12. Caregiver participation in at least 80 percent of scheduled caregiver training sessions. Caregiver training is defined as the education and development of caregiver-mediated ABA strategies, protocols, or techniques directed at facilitating, improving, or generalizing social interaction, skill acquisition and behavior management, to include observational measures for assurance of treatment integrity. Caregiver training must be specific to the member’s identified needs and addressed in the treatment plan. It is recommended that one hour of caregiver training occurs for the first 10 hours of direct line therapy, with an additional 0.5 hours for every additional 10 hours of scheduled direct line therapy unless contraindicated or caregiver declines. Caregiver training requirements should increase to a higher ratio of total direct line therapy hours as increased number of member goals address activities of daily living, as provider plans for transition to lower level of care within the next 6 months or as member comes within one year of termination of benefits based on policy benefit restrictions. Caregiver training is necessary to address member’s appropriate Generalization of skills, including activities of daily living, and to potentially decrease familial stressors by increasing member’s independence. ABA principles utilized during caregiver training to achieve desired outcomes may include, but are not limited to, reinforcement, task analysis, prompting, fading, shaping and chaining;

13. Transition and aftercare planning should begin during the early phases of treatment. Transition planning should focus on the skills and supports required for the member to
transition into their normal environment as appropriate to their achieved and realistic developmental ability. The aftercare planning includes the identification of appropriate services and supports for the time period following ABA treatment. The planning process and documentation should include active involvement and collaboration with a multidisciplinary team. Goals must be developed specifically for the individual with ASD, be functional in nature, and focus on skills needed in current and future environments. The plan must include the specific skills essential for both the family and member to succeed and how they are actively being addressed. It must include a detailed strategy for moving to less intensive ABA care and detail how hours will be faded. The plan must connect to measurable objectives for caregivers and member.

Exclusion Criteria (not intended to be all-inclusive)

The following services have insufficient or no evidence to support efficacy and do not meet medical necessity:

- Services that are purely academic and duplicate or replicate academic learning in a school setting;
- Services that are not congruent with the Autism Spectrum Disorder for Applied Behavior Analysis Medical Necessity Coverage Criteria and/or the Service Intensity Guidelines;
- Services that address or treat symptoms other than the core symptoms of Autism.
- Cognitive Therapy or retraining;
- Treatment that is considered to be investigational/experimental, including, but not limited to: Auditory Integration Therapy; Facilitated Communication; Floor Time (DIR, Developmental Individual-difference Relationship-based model); Higashi Schools/Daily Life; Individual Support Program; LEAP; SPELL; Waldon; Hanen; Early Bird; Bright Start; Social Stories; Gentle Teaching; Response Teaching Curriculum and Developmental Intervention Model; Holding therapy; Movement Therapy; Music therapy; Pet Therapy; Psychoanalysis; Son-Rise Program; Scotopic Sensitivity training; Sensory Integration training; Neurotherapy (EEG biofeedback); Gluten-free/Casein-free diets; Mega-vitamin therapy; chelation of heavy metals; Anti-fungal drugs for presumed fungal infection; Secretin administration;
- Respite, shadow, para-professional, or companion services in any setting;
- Personal training or life coaching;
- ABA services in residential facilities to replace or augment the internal behavioral health or ABA program;
- Custodial care with focus on activities of daily living - bathing, dressing, eating and maintaining personal hygiene, etc. - that do not require the special attention of trained/professional ABA staff;
• Any program or service performed in nonconventional settings (even if the services are performed by a licensed provider), including: spas/resorts; vocational or recreational settings; Outward Bound; and wilderness, camp or ranch programs.

Exclusions listed in this section are not all-inclusive. State mandates and the controlling health plan may have benefit limitation and exclusions not listed in this medical necessity coverage criteria.

**Definitions**

• **Clinical Significance:** Clinical significance is the measurement of practical importance of a treatment effect – whether it creates a meaningful difference and has an impact that is noticeable in daily life.

• **Core deficits of Autism:** persistent deficits in social communication and social interaction across multiple contexts AND, restricted, repetitive patterns of behavior, interests, and activities

• **Generalization:** skills acquired in one setting are applied to many contexts, stimuli, materials, people, and/or settings to be practical, useful, and functional for the individual. Generalized behavior change involves systematic planning, and needs to be a central part of every intervention and every caregiver training strategy.

• **Baseline Data:** objective and quantitative measures of the percentage, frequency or intensity and duration of skill/behavior prior to intervention

• **Mastery Criteria:** objectively and quantitatively stated percentage, frequency or intensity and duration in which a member must display skill/behavior to be considered an acquired skill/behavior

• **Functional Analysis:** Empirically supported process of making systematic changes to the environment to evaluate the effects of the four testing conditions of play (control), contingent attention, contingent escape and the alone condition, on the target behavior, which allows the practitioner to determine the antecedents and consequences maintaining the behavior

• **Neurological Evaluation:** This needs to be completed and documented on every member by a licensed physician as part of the diagnostic evaluation. Any significant abnormalities on the minimal elements of an exam should trigger a referral to a neurologist to perform comprehensive testing to assess neurological abnormalities. Minimal elements include:
  - Evaluation of Cranial nerves I-XII
  - Evaluation of all four extremities, to include motor, sensory and reflex testing
  - Evaluation of coordination
  - Evaluation of facial and/or somatic dysmorphism
Evaluation of seizures or seizure like activity

- **Standardized Assessments**: the listed assessments are not meant to be exhaustive, but serve as a general guideline to measure intelligence, adaptive behaviors or provide diagnostic assessment.

- **Custodial Treatment**: Non-skilled, personal care. Examples include:
  - help with activities of daily living, such as bathing, dressing, eating, getting in or out of a bed or chair, moving around, using the bathroom, preparing special diets, and taking medications
  - Care designed for maintaining the safety of the member or anyone else
  - Care with the sole purpose of maintaining and monitoring an established treatment program

- **Respite Care**: care that provides respite for the individual’s family or persons caring for the individual

- **Interpersonal Care**: interventions that do not diagnose or treat a disease, and that provide either improved communication between individuals, or a social interaction replacement

- **Paraprofessional Care**: services provided by unlicensed persons to help maintain behavior programs designed to allow inclusion of members in structured programs or to support independent living goals except as identified in state mandates or benefit provisions

**Autism Specific Assessments**
- Childhood Autism Rating Scale, second edition. (CARS-2)
- Childhood Autism Spectrum Test. (CAST)
- Social Communications Questionnaire (SCQ)
- Social Responsiveness Scale, second edition. (SRS-2)
- Autism Behavior Checklist (ABC)
- Gillian Autism Rating Scale (GARS)
- Aberrant Behavior Checklist
- Autism Diagnostic Observation Schedule, second edition. (ADOS-2)
- Autism Diagnostic Interview, revised. (ADI-R)
- Checklist for Autism in Toddlers (CHAT)

**Other Assessment Instruments**
- Vineland Adaptive behavior Scale (VABS)
- Adaptive behavior Assessment Scale (ABAS)

**Cognitive Assessments**
- Leiter International Performance Scale-R
- Mullen Scales of Early Learning
- Bayley Scales of Infant Development
- Kaufmann Assessment Battery for Children, second edition. (K-ABC-II)
- Wechsler Preschool and Primary Scale of Intelligence, third edition. (WPPSI-III)
- Wechsler Intelligence Scale for Children, fourth edition. (WISC-IV)
- Test of Non-Verbal Intelligence, fourth edition (TONI-4)
